

SmartLamps™

Manufactured in a 7-step process, they are the *only* patented lamps smart enough to tan the face, body and legs at the same rates for even tanning (pink-blue-pink). (All other lamps are only a 3-step process- lamps that are blue or pink top to bottom use only a 3 step process).

Pink – top of lamp – facial area – lamp strength is boosted up as everyone wants their facial area to have more color.

Blue- mid-section of your body is the easiest to tan, this part of the lamp doesn't need to be as strong to give a very good tan.

Pink – bottom of the lamp – the lower leg is the hardest part of your body to tan – pink at the bottom has the strongest UVB of the lamp.

And with SmartLamps™, even the glass is smart. It's called SolGlass™, and it is the *only* lamp glass that allows delivery of UV light between 280 to 310 nanometers; the part of the UV spectrum that stimulates Vitamin D production in the body.

All other lamps only produce an immediate tan that fades over the next day or two. HEX systems produce an immediate tan, however, unlike other tanning lamps, Smart lamps (with a special gas mix) work in concert with our electronic ballasts – the result is that the tan color is enhanced over the next 4-5 days; persistent tan (laboratory tested)- no other tanning system delivers a persistent tan. Residents do not have to tan as often to get the same color which means less usage on the tanning systems, less maintenance and longer lamp life. *The persistent tan puts HEX light years ahead of other tanning systems.*
